

ClickPly

Assembly Instructions

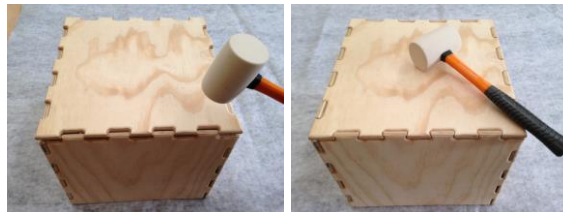

Clickply is easy to assemble. Using a rubber mallet (preferably white rubber so not to mark the wood) you are ready to begin.

Lay out the components in the way they need to be configured. Take the left panel as shown above and the one to its right and using the mallet knock them together starting at one corner and working forward.

Follow the same routine with the third piece. Next turn the assembled component over and attach the final side. Check all joints to make sure they fit properly.

Finally, stand the item so it is ready to accept the final piece. Using the mallet tap into place starting at one corner and progressing around the panel until properly clicked home.

The finished item.

Additional Assembly Instructions

If you do not have a rubber mallet use a regular hammer and an old piece of wood as shown in the above photo.

When assembling legs on tables and some stools make sure you place the leg onto a solid work surface. Starting at the bottom of the leg work to the top of the leg. If the leg is not supported in this way it could break when being hit hard with the mallet.
